
Abstract

This invention is directed to a system and method for storing font image data, which is already rendered, in a history-based order on the server side. This avoids the server side processing time to render the font every time a request is received. This allows users to use many server side fonts that users may not have on their client workstations. In the method, the user uses a web browser to choose a font type, size, and style from a list of available fonts installed on the server. The system then determines if the selected font exists in the font repository. If the font exists, the system retrieves the font images from the font repository. If the font does not exist, the system creates the font images and stores the font images to the font repository.
